

# Why You Should Buy LED Book Reader Light for Reading in the Dark

What do you do when you are out camping and want to read a book but don't have light at night? What would you use if you don't have a Kindle to read on? Today, we will discuss [LED Book Reader Light](#) to give you the best experience when this is your situation. Let's see if this product holds up to what it was meant to do in the first place.

## The Pros and Cons of LED Book Reader Light

Besides reading physical books in the dark, the following are the benefits of this device:

- It is very lightweight so that you can easily carry it in your bag to the place or location where you might need it. Much better in portability than other clamp-on led lamp lights.
- This device is best for when traveling, especially during nighttime when all lights are off, like using on a plane or train.
- Suitable for reading books when others are asleep, and you don't want to keep a light on for reading.
- The size of 15.8-17.6cm is big enough for most books.

Some of the flaws in this device are:

- As it is a thin and ultraportable device, it is brittle, so carry it with the box it came in so as not to break it easily. Also, use the plastic cover when not using to avoid scratching the surface.
- You cannot control the intensity of the light.
- Requires 3 AAA batteries, so no rechargeable battery installed. You need to buy them separately as the device doesn't have any.
