Key macro is a macro command that is used to hide the data you do not want to show in the workbook. The key macro function is very useful for those users who want to modify Microsoft Access workbooks using any third-party application, because the macro code can be hidden in the workbook without affecting its compatibility with third-party applications. Description: Description: Highlights of Key macro: Data: Key macro can be used to hide the table data or all the cells in a table. This feature is a very important for users who want to protect their data or some cells in a table without leaving any trace in the workbook. Drawing: With the help of key macro function, it is very easy to replace the data with a new picture in the workbook. Help/Help: Help or even knowledge base of any command in any standard MS Access workbook can be used through this feature. The information about the command is stored in the macro, so if anyone needs to modify the workbook using a third-party application, he doesn't need to worry about the change in the help or knowledge base because they will not affect the workbook's compatibility with third-party applications. Versioning: The unique ID of the workbook can be used to version the workbook. When any modification is done on the workbook, the workbook can be stored in the versions. The workbook can be restored from its versions or even from a specific version. Overview: Documentation: 1-Click Keys. Saving Document: User can save the workbook in two formats: XML and HTML. These two formats will store the workbook's data in XML files, and this

file can be opened and edited by any third-party application. On the other hand, the workbook can be saved in HTML format. HTML will store the workbook's data in an HTML file, and this file can be opened by any web browser. Viewing Key Code: Key macro includes two commands: Code and MView. Code will open the workbook and the user can view the key code that is used to hide data in the workbook. Mview opens the workbook in a new page so that it is very easy to view the key code without opening the workbook. Code: Code macro can be used to view the key code that is used to hide the data in the workbook. It can also hide the
